The present invention describes a composition comprising a prepared hepatitis C virus (HCV) epitope such as those given in AAJ00010-AAJ04121. These are derived from HCV HLA-binding motifs. They are useful in vaccines for the prevention and treatment of HCV infection in humans. The present sequence is an epitope used in the disclosure of the invention.
                                                                                                                                                                                                                         Hepatitis C virus; HCV; epitope; vaccine; immunogen; HLA-binding motif;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A new composition useful as a vaccines against hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Hepatitis C virus; HCV; immunogen; core region; nucleocapsid; immunodominant; T cell epitope; vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Score 46; DB 22; Length 15;

                                                                                               The present invention describes a composition comprising a prepared hepatitis C virus (HCV) epitope such as those given in AAJ00010-AAJ04121. These are derived from HCV HLA-binding mctifs. They are useful in vaccines for the prevention and treatment of HCV infection in humans. The present sequence is an epitope used in the disclosure of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes a composition comprising a prepared hepatitis C virus (HCV) epitope such as those given in AAJ00010-AAJ04121. These are derived from HCV HLA-binding motifs. They are useful in vaccines for the prevention and treatment of HCV infection in humans. The present sequence is an epitope used in the disclosure of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                A series of overlapping peptides (including the present sequence) was synthesised based on sequences in the core, El and EZ/MS1 regions of hepatitis C virus. The peptides were used as antigens in lymphoproliferative assays to identify the main T-cell epitopes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                         Hepatitis C Virus immunogenic polypeptide contg. a T-cell stimulating epitope - from core, El, E2 and NS3 regions, useful in production of vaccines, therapeutic agents, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel composition comprising a hepatitis C virus antisense polynucleotide which is complementary to or corresponds to a sense strand of the virus genome, and selectively hybridises to it -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Protein encoded by a novel hepatitis C virus cDNA clone CA216a.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0;

Patent No. 5866139
GENERAL INFORMATION:
APPLICANT: Brechot, Christian
APPLICANT: Kremsdorf, Dina
APPLICANT: Porchon, Colette
TITLE OF INVENTION: Nucleotide and Peptide Sequences of a
TITLE OF INVENTION: Hepatitis C Virus Isolate, Diagnostic and Therapeutic
TITLE OF INVENTION: Applications
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 31, Application US/08483695
Patent No. 5866139
GENERAL INFORMATION:

Sequence 31. Application US/07965285

Sequence 31. Application US/07965285

Patent No. 5879904

SEMERAL INFORMATION:

APPLICANT: Brechot, Christian

APPLICANT: Brechot, Colette

TITLE OF INVENTION: Nuclectide and Peptide Sequences of a

TITLE OF INVENTION: Nuclectide and Peptide Sequences of a

TITLE OF INVENTION: Applications

NUMBER OF SEQUENCES: 46

CORRESPONDENCE ADDRESS:

ADDRESSEE: Finnegan, Henderson, Farabow, Garrett &

STREET: 1300 I Street, N.W.

CITY: Washington

STRATE: DC

$18031
genome polyprotein - hepatitis C virus (isolate JK2) (fragment)
N.Contains: core protein; envelope protein 1; nonstructural protein 2; NS1/E2 protein
C; Species: hepatitis C virus
A; Variety: isolate JK2
C; Date: 30-Jun-1992 #sequence_revision 30-Jun-1992 #text_change 17-Nov-2000
C; Accession: $18031
R; Honda, M.; Kaneko, S.; Masashi, U.; Kobayashi, K.; Murakami, S.
Submitted to the EMBL Data Library, September 1991
A; Description: Sequence analysis of putative structural regions of Hepatitis C virus isc
A; Reference number: $18029
A; Residues: 1-782 <#Nose structural regions of Hepatitis C virus genome capside protein; envelope protein; glycoprotein; nonstructural
A; Residues: 1-782 <#Nose structural source: isolate JK2
C; Superfamily: hepatitis C virus genome polyprotein
F: 1-191/Product: core protein #status predicted <MATI>F: 192-383/Product: envelope protein #status predicted <MATI>F: 34-733/Product: nonstructural protein 2 (fragment) #status predicted <MATI>F: 734-782/Product: nonstructural protein 2 (fragment) #status predicted <MATI>F: 734-782/Product: nonstructural protein 2 (fragment) #status predicted <MATIP

**I. FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.

**NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.

**NS3 AND NS5 MAY PLAY A ROLL IN THE VIRAL RNA REPLICATION.

**C. -!- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 precursor polyprotein.

**C. -!- SUBUNIT: THE VIRION OF THIS VIRUS IS A NICLEORAPSID COVERED BY A
Genome polyprotein (Contains: Capsid protein C (Core protein) (P22); Genelope glycoprotein E1 (GP32) (GP35); Envelope glycoprotein E2 (GP68) (GP70) (GR12) (GP51); Envelope glycoprotein E2 (GP68) (GP70) (MS1); Protease/helicase NS3 (P70) (Hepacivirin) (EC 3.4.22.-); Protease/helicase NS3 (P70) (Hepacivirin) (EC 3.4.21.98); Nonstructural protein NS48 (P47); Nonstructural protein NS58 (P56); Nonstructural protein NS58 (P56); Nonstructural protein NS58 (P66) (P70) (RNA-directed RNA polymerase) (EC 2.7.7.48)]. Hepatitis C virus (1solate 1) (HCV).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Pfam; PF00998; HCV_RGRP; 1.

I- FUNCTION, NSSA SEEMS TO HAVE A TRANSCRIPTIONAL ACTIVATORY ROLE.

C. I- FUNCTION: NSSA SEEMS TO HAVE A TRANSCRIPTIONAL ACTIVATORY ROLE.

C. I- FUNCTION: NSSB IS A RNA-DEPENDENT RNA POLYMERASE THAT PLAYS AN ESSENTIAL ROLE IN THE VIRUS REPLICATION.

C. I- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in Pl and Ser or Ala in Pl'.

C. I- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN BUVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: E1 CHOPROTEIN BUVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: E1 CHOPROTEIN ENVELOPES THE HOST SIGNAL PEPTIDASES.

C. I- PTM: THE STRUCTURAL PROTEINS C, E1 AND E2 ARE PRODUCED BY PROTEOLYTIC PROCESSING BY THE HOST SIGNAL PEPTIDASE FAMILY C18.

C. I- SIMILARITY: THE NS3 PROTEASE BELONGS TO PEPTIDASE FAMILY S29.
                                                                                                                                                                                                                                                              oligonucleotide: the crystal structure provides insights into the mode
                                                                                             Weber P.C.;

6Genome polyprotein [Contains: Capsid protein C (Core protein) (P22);
6DN-80 (GP70) (NS1); Protein P7; Nonstructural protein NS2 (P21)
(EC 3. 4.22.-); Proteass/helicase NS3 (P70) (Hepaclytin)
(EC 3. 4.21.98); Nonstructural protein NS4A (P4); Nonstructural protein
NS4B (P27); Nonstructural protein NS5A (P56); Nonstructural protein
NS5B (P66) (P70) (RNA-directed RNA polymerase) (EC 2.7.7.48)].
VIROLOGY 188:331-341(1992).

-!- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION. NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
-!- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: PROTEIN AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    MAJOR ENVELOPE PROTEIN E (POTENTIAL). MAY PLAY A ROLE IN THE VIRAL RNA RELATED FUNCTION.
NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA RELATED FUNCTION.
NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA RELATED FUNCTION.
C-I-CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in Pl and Ser or Ala in Pl'.
C-I-SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPACTEIN MAND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Polyprotein; Glycoprotein; Transferase; RNA-directed RNA polymerase; Gore protein; Coat protein; Envelope protein; Helicase; AFP-binding; Transmembrane; Nonstructural protein; Hydrolase; Serine protease. FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.

NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.

CATALYTIC ACTIVITY: HYDROLYSIS OF four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in P1 and Ser or Ala in P1'.

SUBBURT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:

PROTEIN M AND GLYCOPROFIEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN CAND MRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Polyprotein; Glycoprotein; Transferase; RNA-directed RNA polymerase;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SIMILARITY).

Genome polyprotein (Contains: Capsid protein C (Core protein) (P22);
Bnvelope glycoprotein El (GP32) (GP35); Envelope glycoprotein E2
(GP68) (GP70) (NS1); Protein P7; Nonstructural protein NS2 (P21)
(EC 3. 4.22.-); Proteases/Helicase NS3 (P70) (Hepacivirin)
(EC 3. 4.22.-); Nonstructural protein NS4A (P4); Nonstructural protein NS4B (P27); Nonstructural protein NS5A (P56); Nonstructural protein NS5B (P66) (P70) (RNA-directed RNA polymerase) (EC 2.7.7.48)].
Hepatitis C virus (isolate Taiwan) (HCV).
Viruses; SSRNA positive-strand viruses, no DNA stage; Flaviviridae;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in P1 and Ser or Ala in P1.
SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C. AND MRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           genotypes.";
Virology 188:331-341(1992).
-!- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE
- FUNCTION: THE SMALL PROTEING A POSSIBLE MEMBRANE-RELATED FUNCTION.
NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
-!- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY.
LIPOPROTEIN MAND GLYCOPROTEIN E. THE BUVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C. AND MRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                         MEDLINE-92230232; PubMed-1314459; Okamonto K., Lizuka H., Okamoto H., Kurai K., Okada S.I., Yamamoto K., Lizuka H., Tanaka T., Fukuda S., Tsuda F., Mishiro S.; "Full-length sequence of a hepatitis C virus genome having poor homology to reported isolates: comparative study of four distinct
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (POTENTIAL).

-!- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE HYDROPHOBITC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.

NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.

-!- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprocein, commonly with Asp or Glu in the P6 position, Cys or Thr in P1 and Ser or Ala in P1'.

-!- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             MEDLINE=92230232; PubMed=1314459; Okada S.-I., Yamamoto K., Lizuka H., Tanaka T., Fukuda S., Tsuda F., Mishiro S., Stitis Tsuda F., Mishiro S.; Tsuda F., Mishiro S.; Fukuda S., Tsuda F., Mishiro S.; Isuda F., Mishiro S.; Isuda F., Mishiro S.; Isuda F., Mishiro S.; Isuda Genome having poor homology to reported isolates: comparative study of four distinct

MATRIX PROTEIN (POTENTIAL).
MAJOR ENVELOPE PROTEIN E (POTENTIAL).
NONSTRUCTURAL PROTEIN NSJ/E2 (POTENTIAL).
NONSTRUCTURAL PROTEIN NS2 (POTENTIAL).
PROTEASE/HELICASE NS3 (POTENTIAL).
CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in P1 and Ser or Ala in P1.
SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIDOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GIYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              NONSTRUCTURAL PROTEIN NS4A (POTENTIAL).

The continuous of two cytochrome P450 isozymes related to CYP2A and reveal amilies from monkey (baboon, Papio papio) liver microsomes. Cross reactivity with human forms.";

Eur. J. Biochem. 204.641.648(1992).

Eur. J. Biochem. 204.641.648(1992).

- I- FUNCTION: EXHIBITS A HIGH COUMARIN 7-HYDROXILASE ACTIVITY.

- CATALYTIC ACTIVITY: RH + reduced flavoprotein + O(2) = ROH + OXIGIZED (LIVER LOCATION: Membrane-bound. Endoplasmic reticulum.)

- ISUBCELLUIAR LOCATION: Membrane-bound. Endoplasmic reticulum.

- INDUCTION: BY PHENOBARITAL.

- INDUCTION: BY PH

                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a method of inducing and/or sustaining an immunological cytotoxic T lymphocyte (CTL) response in a mammal. The method comprises: (a) delivering an antigen to the mammal at a level to induce an immunological CTL response in the mammal; and (b) maintaining the level of the antigen in the mammal's lymphatic system to maintain the immunologic CTL response. The method can be used for the delivery of e.g. a differentiation antigen, a tumour-specific multilineage antigen,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       an embryonic antigen, an oncogine antigen, a mutated tumour-suppressor gene antigen, or a viral antigen. They can be used for the treatment of disease such as cancer, e.g. mallghant melanoma or infectious disease, e.g. viral disease such as hepatitis or AIDS. Sustained antigen delivery to the lymphatic system provides for potent CTL stimulation that takes that is necessary to keep CTL active, cytotoxic and recirculating through the body. AAX10071 to AAX10639 represent examples of peptide
from the core, E1, E2/NS1, NS2, NS3, NS4 or NS5 regions. The peptides were tested for peptide specific cytotoxic T-cell activity. The peptides AAR84570-77 were found to have substantial homology with a T-cell epitope and are useful in vaccines against HCV infection.
                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Inducing a cytotoxic T lymphocyte response - by maintaining a level of antigen in the lymphatic system of a mammal so as to provide a sustained CTL response, used to treat, e.g. AIDS
                                                                                                                                                                                                                                                                                                                                                        Cytotoxic T-lymphocyte response; CTL; antigen; lymphatic system; immunisation; tumour; infectious disease; immunotherapy; cancer; malignant melanoma; viral disease; hepatitis; AIDS.

They can be used for the treatment of disease such as cancer, e.g. malignant melanoma or infectious disease, e.g. viral disease such as hepatitis or AIDS. Sustained antigen delivery to the Iymphatic system provides for potent CTL stimulation that takes place in the miliau of the Iymphoid organ, and it sustains stimulation that is necessary to keep CTL active, cytotoxic and recirculating through the body. contains an N-terminal glutamic acid (Glu) or glutamine (Cln) residue in the form of an addition salt with a strong, physiologically acceptable acid (II). Also described are: (a) a pharmaceutical composition containing at least one (I); (b) a vaccine containing at least one (I) where this is a major histocompatibility complex (MHC) ligand (Ia); (c) a method for in vitro diagnosis of diseases associated with the presence of (Ia); (d) a kit for method (c) that includes a (Ia); and (e) a process for preparing (I). (I) has immunomodulator, endocrine, antiallerist, meuroprofectent, virucidal, bactericidal, antiparasitio, fungicidal and cytostatic activities. (I) are useful, in human or veterinary medicine, in pharmaceutical compositions (for treating immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              disorders, e.g. immune deficiency, autoimmune states, hypersensitivity, allergy, graft rejection, infection, hormonal disorders and central nervous system diseases), also, where (I) is a MHC ligand (Ia), in vaccines for treatment or prevention of: (1) viral, bacterial, parasitic or fungal infections; or (ii) of cancers. A particular application is in anti-melanoma vaccines. (I) are also useful for in vitro diagnosis of diseases associated with interactions between MHC and (I), e.g. melanoma and human immunodeficiency virus infection. AAM98898 to AAM99592
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Stabilized pharmaceutical containing N-terminal glutamic acid or glutamine, useful e.g. in anti-melanoma vaccines, is an addition salt with strong acid \cdot

The present sequence is a specifically claimed example of such a T-cell epitope-containing peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

This peptide is one of 19 specifically claimed antigens based on the immunoreactive regions of the envelope protein and non-structural proteins NS-1, NS-2, NS-3 and NS-5 for the Hepatitis C virus. The invention also concerns analogues, segments, mixtures, conjugates and polymers of these peptides. The C-terminal amino acid may be amidated. See AAR20751-R20782.
                                                                                                                                                                                                                                                                                                                                   New synthetic peptide specific for HCV antibodies - for detection of HCV or NANBHV e.g. by enzyme-linked immunosorbent assay and is immunogen for preparation of vaccines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Structured antigenic peptide library; SSAL; vaccine; diagnostic; therapeutic; hepatitis C virus; HCV.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAR90965-R90980 and AAR90995-R91015 represent synthetic hepatitis C virus (HCV) El and E2 peptides used in competition studies. This sequence represents a synthatic El peptide, and corresponds to residues c sequence represents a synthatic El peptide, and corresponds to residues control of the El protein sequence. These sequences are useful for in viro monitoring of HCV disease, or prognosis of the response to interferon treatment of patients suffering from HCV infection. These sequences compete with the proteins produced by AAT12704-T12709 and AAT12961-T12974, which are included in vectors for the production of recombinant El, E2, and E1/E2. The recombinant proteins can then be isolated and purified by carrying out a disulphide bond cleavage agent, after lysis of recombinant host cells. The constructs containing the purified HCV envelope proteins can be used for vaccinating humans against HCV, for in vitro detecting one or more serological types of HCV present in a serotyping assay for detecting one or more serological types of HCV present in a solid substrate and incorporated into a reversed phase hybridisation assay for determining the presence or the genotype of HCV. The new purification method preserves the conformation of the recombinantly expressed E1, E2 and E1/E2, and eliminates contaminating proteins. Antigens isolated because the contaminating proteins. Antigens isolated because the contaminating the presence or the genotype of the recombinantly expressed E1, E2 and E1/E2, and eliminates contaminating proteins. Antigens isolated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        .;

In a structured synthetic antigen library, specific amino acids and their frequency of appearance at a variant locus within aligned peptide sequences are defined by the primary sequences of the several variants that make up the alignment used to construct the antigen peptide library. Branched SSALs representing the highly variable yet antigenic regions of the HCV Env and NSI proteins are given in AARA4333-37 and were used as the key ingredients in a polyvalent vaccine for highly divergent global strains of HCV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 the alpha and the epsilon amino groups. Lys(47) may be amidated if amino acid 48 is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              "the lysine residue is joined to two 44mer
peptides via the alpha and epsilon amino
groups"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /note= "i.e. is any amino acid containing no side

    "the lysine is joined to Lys(45) via its alpha-amino group and to Lys(47) via its alpha-carboxyl group. The epsilon amino group forms a peptide bond with a lysine group which carries two 44mer peptides"

                                                                                                                             The 44mer peptide component (amino acids 1-44) corresponds to peptide 19 (see AAR20769) taken from hepatitis C. There are a total of 8 such 44mer peptides in the polymeric peptide, each attached to the branching poly-L-lysine resin. Peptide immunogens comprising 16, 8, 4 or 2 peptides attached to poly-L-lys resin are claimed (see Claim 21). See AAR20751-R20782.

The specification describes a pharmaceutical composition which comprises a hepatitis C virus (HCV) antisense polynucleotide. The HCV is characterized by a positive stranded RNA genome which has 40% homology at the polypeptide level to a HCV polyprotein. The antisense polynucleotide binds to cellular polynucleotides which enhance and/or are required for viral infectivity, replicative ability or chronicity. The antisense polynucleotides may also be designed to bind with high specificity, to be of increased stability, to be stable and to have low toxicity. The composition also comprises an agent which causes viral RNA to be inactive. The composition is used for preventing HCV replication in a system. The present sequence is encoded by a novel HCV cDNA sequence, which is used in the course of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The HCV is characterized by a positive strande RNA genome which has 40% homology at the polypeptide level to a HCV polyprotein. The antisense polynucleotide binds to cellular polynucleotides which enhance and/or are required for viral infectivity, replicative ability or chronicity. The antisense polynucleotides may also be designed to bind with high specificity, to be of increased stability, to be stable and to have low toxicity. The composition also comprises an agent which causes viral RNA to be inactive. The composition is used for preventing HCV replication in a system. The present sequence is encoded by a novel HCV cDNA sequence, which is used in the
